B08501011_hw4_report

Q1:

Q2:

Calculate shannon capacity:

Calculate interference caused by other base stations first , and then add thermal noise.

Second, calculate SINR = signal power / interference.

Calculate Shannon capacity = 10M / 50 * log2(1 + SINR)

超過一定距離後別的 base station 干擾太大,造成 SINR 為負,capacity 為零無法傳輸。

Q3:

High CBR = 800 bits/s Medium CBR = 600 bits/s Low CBR = 400 bits/s

Bits loss rate = total loss bits / total sent bits

本次模擬大約有 0.2 的 mobile station 傳輸上限為零,因此在每秒 600 bits / s 下,大約有 600*50*0.2=6000 bits /s 進入 buffer,1000s 後 buffer 滿,因此 bits loss rate 約等於 0.2,與結果大致相符。
